INTRODUCTION

The after effects of Covid-19 can be dangerous. It can lead us to other health problems or diseases after one or five months of testing positive

THESIS STATEMENT

The US Centers for Disease Control and Prevention (CDC) has highlighted three new conditions that can emerge one to five months after testing positive for COVID-19

BODY PARAGRAPH

- ❖ Shortness of breath, heart rate abnormalities, type 2 diabetes are more likely to emerge in those people who tested positive for COVID-19 even after five months.
- ❖ Researchers tested a massive Number of people under the age of 20 or older for COVID-19 and Observed them for 150 days according their test result.They found that some specific health conditions were more common in those who tested positive for covid-19 and were hospitalized.
- ❖ Anxiety and depression was more common among the younger People tested positive for covid-19. Some people even needed mechanical ventilation after being suffering from nerve and muscle pain.

CONCLUSION

Though it is unclear that how these exactly COVID-19 is causing these ongoing symptoms but some theories refer to an overstimulation of the immune system during initial infection, which then becomes difficult to turn off. The immune system then starts attacking healthy body tissue including the pancreas, heart and lungs, increasing the risk of diabetes, heart conditions and shortness of breath.
